

POWER MODULE ADAPTER

ABSTRACT

5 The adapter couples a power module to a circuit board. An adapter embodying the present invention can be configured to allow the connection of any power module regardless of pin out to any circuit board. Signal modifying circuitry can also be added to the adapter to enhance or simply modify the signal to the end user's circuit board. The modifying circuitry can act on either the input to the adapter or the output from the adapter. At least one conductive path couples the input interconnects and the output interconnects.
